EXECUTION OF UNVERIFIED PROGRAMS IN A WIRELESS DEVICE OPERATING ENVIRONMENT

ABSTRACT OF THE DISCLOSURE

A computer device having wireless communication capability and a computer platform with a resident application environment for selectively downloading applications to the platform across the wireless network with a predefined security protocol for downloading and executing applications at the platform, such as verifying the presence of a certificate. The download manager is resident on the computer platform and allows download, storage, and execution of applications that do not otherwise comply with the security protocol of the resident application environment.
